

2 Sodium, aluminium and silicon are solid elements with a silver colour. These elements react with oxygen to form oxides with high melting points. Aluminium is a reactive metal, but it resists corrosion in water because it has a surface coating of aluminium oxide.

2 (a) In terms of its structure and bonding, explain why silicon dioxide has a high melting point.

.....

2 (b) State the type of bonding in aluminium oxide.

.....

(1 mark)

2 (c) Write an equation for the reaction of aluminium with oxygen.

.....

(1 mark)

2 (d) Suggest **one** property of the aluminium oxide coating that causes aluminium to resist corrosion in water.

.....

(1 mark)

2 (e) Sodium metal is **not** resistant to corrosion in water, despite having a surface coating of sodium oxide. Write an equation to show how sodium oxide reacts with water.

.....

(1 mark)

2 (f) Aluminium oxide is amphoteric. It reacts with acids and alkalis.

2 (f) (i) Write an equation for the reaction between aluminium oxide and hydrochloric acid.

.....
(1 mark)

2 (f) (ii) Write an equation for the reaction between aluminium oxide and an excess of aqueous sodium hydroxide.

.....
(1 mark)

2 (g) Silicon dioxide does **not** react with hydrochloric acid but it does react with sodium hydroxide. State **one** property of silicon dioxide that can be deduced from this information and write an equation for its reaction with sodium hydroxide.
